

Manage Your Breathing with Propeller

What is Propeller?

Propeller makes it easy to stick to your asthma or COPD treatment plan and helps you learn what may be causing your flare-ups, so you can have more symptom free days.

Snap-On Sensors

Propeller sensors attach to your existing inhalers. They automatically track how often you use your medication, and they can chime when it's time to take a dose.

Smartphone App

Information is sent to your smartphone, and the app learns more about your flare-ups and medication use over time. Propeller app can help you become an expert at managing your symptoms and identifying your triggers.

Sharable Reports

Your care team can view this information, adjust your treatment plan as required and provide better care for your asthma or COPD.

How does Propeller help?

Propeller helps you and your care team understand what may be causing your symptoms. You can work together to develop a treatment plan that helps you live a healthy, active life.
